                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    regulatory subunits.

SUBUNIT: Homotetramer or heterotetramer with KCND1 and/or KCND2. Associates with the regulatory subunits KCNIP1, KCNIP2, KCNIP3 a KCNIP4. Interacts with KCNE1, KCNE2, SCN1B and KCNAB1 (By similarity).

SUBCELLULAR LOCATION: Integral membrane protein.

SUBUNIT: Homotetramer or heterotetramer with KCND1 and/o Associates with the regulatory subunits KCNIP1, KCNIP2, KCNIP4. Interacts with DPP6, DLG4 and FREQ. Interacts wi and FLNC (By similarity).

I SUBCELULAR LOCATION: Integral membrane protein.

I TISSUE SPECIFICITY: Detected in brain frontal cortex.

I DOMAIN: The segment S4 is probably the voltage-sensor an characterized by a series of positively charged amino accevry third position.

PTM: Phosphorylated on serine and threonine residues (By

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: Homotetramer or heterotetramer with KCND1 and/or KCND3. Associates with the regulatory subunits KCNIP1, KCNIP2, KCNIP3 a KCNIP4. Interacts with DP6, DLG4 and FREQ (By similarity). Interacts with FLNA and FLNC.

SUBCELLULAR LOCATION: Integral membrane protein. Detected in dendrites in cultured hippocampal neurons.

TISSUE SPECIFICITY: Highly expressed throughout the brain. Expression is very low or absent in other tissues.

DOMAIN: The segment S4 is probably the voltage-sensor and is characterized by a series of positively charged amino acids at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   similarity).

```

The present sequence is the protein sequence of the short isoform of novel human potassium channel Kv4.3. 2 Isoforms of human Kv4.3 have been identified: a full-length form (hKv4.3 long) (see ABB79584); and the short form, which has a deletion of 19 amino acids in the carboxy domain after the predicted sixth transmembrane domain (hKv4.3 short). Human heart primarily expresses hKv4.3 long, whereas human brain contains both forms. The invention provides Kv4.3 polypeptides, polynucleotides, and methods for producing these polynucleotides. The Kv4.3 polypeptides and polynucleotides are useful in the diagnosis, treatment and screening of human diseases relating to an excess or deficiency of hKv4.3 activity, including Alzheimer's disease and heart disease

channel hKv4.3. The sequence was deduced from an isolated hKv4.3.

CC polynucleotide (see AAV61571), and has 99% identity with rat Kv4.3.

CC Hydrophobicity analysis indicates 6 transmembrane domains, typical of all CC KV family related proteins. A longer isoform (see AAW79590) has been CC identified, which has an additional 19 amino acids inserted between amino CC acids 487 and 488. The invention relates to hKv4.3 polypeptides and CC polynucleotides, and to methods for producing such polypeptides by recombinant techniques. hKv4.3 polypeptides can be used to identify CC agonists and antagonists of hKv4.3 polypeptides can be used to identify CC claimed are methods for utilising such agonists and antagonists for the treatment of subjects in need of enhanced or reduced activity or expression of hKv4.3 polypeptide. These include the treatment of cardiac arrhythmias and Alzheimer's disease. The invention can also be used to detect disease associated with inappropriate hKv4.3 expression or

                                                                                                                                                    The present sequence is the protein sequence of the long isoform of novel human potassium channel Kv4.3. 2 Isoforms of human Kv4.3 have been identified: the present full-length form (hKv4.3 long); and a second form (see ABB79585), which has a deletion of 19 amino acids in the carboxy domain after the predicted sixth transmembrane domain (hKv4.3 short). Human heart primarily expresses hKv4.3 long, whereas human brain contains both forms. The invention provides Kv4.3 polypeptides, polynucleotides, and methods for producing these polynucleotides. The Kv4.3 polypeptides and polynucleotides are useful in the diagnosis, treatment and screening of human diseases relating to an excess or deficiency of hKv4.3 activity, including Alzheimer's disease and heart disease
                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide encoding human Kv4.3 potassium channel polypeptide, useful as probe in a diagnostic method for detecting acid encoding human Kv4.3, and for treating Alzheimer's and heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Kv4.3; potassium channel; human; Alzheimer's disease; heart

New potassium channel polypeptides, hKv4.3 poly:nucleotide(s) useful in the treatment arrhythmias and Alzheimer's disease. and hKv4.3-encoding of disorders including cardiac

2; Page 26-27; 47pp; English

This is the amino acid sequence for an isoform of human Kv potassium channel hKv4.3. The sequence was deduced from an isolated hKv4.3 polynucleotide (see AAV61572), and has 97% identity with rat Kv4.3. Kydrophobicity analysis indicates 6 transmembrane domains, typical of all Kv4rophobicity analysis indicates 6 transmembrane domains, typical of all Kv4ramily related proteins. A shorter isoform (see AAW79589) has been cidentified, which lacks amino acid residues 488-506 of the longer cisoform. The invention relates to hKv4.3 polypeptides and polynucleotides, and to methods for producing such polypeptides by recombinant techniques. hKv4.3 polypeptides can be used to identify agonists and antagonists of hKv4.3 and to raise specific antibodies. Also claimed are methods for utilising such agonists and antagonists for the treatment of subjects in need of enhanced or reduced activity or expression of hKv4.3 polypeptide. These include the treatment of cardiac arrhythmias and Alzheimer's disease. The invention can also be used to to detect disease associated with inappropriate hKv4.3 expression or Also a11 ç

AC The invention relates to a nematode worm that expresses a heterologous nucleotide sequence encoding a functional voltage-gated potassium channel of the Kv4 family, or its analog, mutant, variant, homolog, ortholog, part or fragment. The nematode worm is useful in determining whether a compound interacts with the voltage-gated potassium channel of the Kv4 family or whether a compound is an agonist, antagonist, opener and/or blocker of the voltage-gated potassium channel expressed by the nematode worm. The methods are used for identifying and developing compounds that interact with voltage-gated potassium channels of the Kv4 family. The compounds may be used in the development and/or preparation of compositions for pharmaceutical, agrochemical and/or veterinary use. These may be used in preparing compositions for preventing or treating cliseases or conditions such as arrhythmia, tachycardia, congestive heart failure, epilepsy, stroke, traumatic brain injury, anxiety, insomnia, and the contract of the current sequence or arrivation of the current sequence. represents wild-type

New potassium channel polypeptides, hKv4.3 poly:nucleotide(s) useful in the treatment arrhythmias and Alzheimer's disease.

    and hKv4.3-encoding
of disorders including

                                                                                                                          cardiac
```

English.

This is the amino acid sequence for an isoform of human Kv potassium CC channel hKv4.3. The sequence was deduced from an isolated hKv4.3 CC channel hKv4.3. The sequence was deduced from an isolated hKv4.3 CC polynucleotide (see AAV61573), and has 98% identity with rat Kv4.3. CC Hydrophobicity analysis indicates 6 transmembrane domains, typical of all CC KV family related proteins. hKv4.3 isoforms (see AAW79589 and AAW79590) CC are also claimed. The invention relates to hKv4.3 polypeptides and CC polynucleotides, and to methods for producing such polypeptides by recombinant techniques. hKv4.3 polypeptides can be used to identify CC agonists and antagonists of hKv4.3 polypeptides can be used to identify CC claimed are methods for utilising such agonists and antagonists for the treatment of subjects in need of enhanced or reduced activity or CC expression of hKv4.3 polypeptide. These include the treatment of cardiac arrhythmias and Alzheimer's disease. The invention can also be used to to detect disease associated with inappropriate hKv4.3 expression or Also

A
                                                The invention discloses a composition comprising two or more isolated rat CC or human polynucleotides or a polynucleotide which represents a fragment, CC derivative or allelic variation of the nucleic acid sequence. Also Cc claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a CC kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound which regulates the expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating colypeptides or their antibodies. The polynucleotide given in the specification, a method for identifying a compound useful in treating pain (e.g. spinal segmental nerve injury (CNung), chronic construction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (described in Table 3 of the specification, but was obtained in electronic form directly from WIPO at ftp. wipo.int/pub/sublished_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New composition comprising preparing a medicament for
